

MHS Plant Label Guidelines

In the spaces provided on the Plant Label Form, please list all plants or plant materials you plan to use in your exhibit. Our standard reference for nomenclature is the Royal Horticultural Society Dictionary *Index of Garden Plants* edited by Mark Griffiths, Timber Press, 1994. The name and ranks of the genera, species, varieties and cultivars used in it are considered correct. You must check the names of your plants against the *Index of Garden Plants* since many references are outdated and many plant catalogs do not use standard names.

The form has boxes labeled GENUS, SPECIES, CULTIVAR and COMMON NAME.

Please alphabetize your list, write neatly, and do not write in spaces marked "MHS use only." The following information is to help you.

GENUS

Plant name must always start with the genus. This word always has an initial capital letter.

Example: *Kalmia*

SPECIES

Most plants will have the name of the species following the genus. It is not capitalized. Example: *Kalmia latifolia*

Some cultivated and wild plants are differentiated into varieties that occur in nature. This is expressed by the abbreviation "var", and the lower case is used. This information should be put in the "species" box. Example: *Kalmia latifolia* var. *occidentalis*.

CULTIVAR

Many plants have forms that arose in cultivation, and do not occur in nature. These forms are called cultivars. They are always placed within single quotes, and always begin with a capital letter.

Example: *Kalmia latifolia* 'Rubra'

Sometimes the species of a plant is not known, but there is a cultivar name. In this instance it is correct to use the name of the genus and the cultivar only. Example: *Rosa* 'Dorothy Perkins'

COMMON NAMES

There are no standards for common names of plants, but where possible, we ask you to choose one that is in common use in New England and that conveys new information. A good example would be *Kalmia latifolia* Mountain laurel. Poor example: *Rosa* 'Dorothy Perkins' Dorothy Perkins rose. Nothing new is conveyed.

INCOMPLETE INFORMATION

In rare cases only the genus is known. In these instances it is permissible to use the abbreviation sp. for species, or cv. for cultivar in place of an exact name. Examples: *Rosa* cv.; *Kalmia latifolia* cv.; *Pinus* sp.

If you only know the common name of a plant you may still find it in the *Index of Garden Plants* where many common names are listed alphabetically with botanical names.

UNKNOWN PLANTS

If you do not know the name of a plant you want to use in your exhibit, refer to any good identification manual or pictorial guide for something that matches your plant. Then check that name against the description in the *Index of Garden Plants*. Other useful identification guides for cultivated plants include:

- *Exotica*
- *The Royal Horticultural Society Encyclopedia of House Plants*
- *Tropicals*
- *The Taylor's Guide series*

Please keep in mind the goals of the Nomenclature Committee, which are to promote the botanically correct, and consistent, identification of plants exhibited at the New England Spring Flower Show. Correct and consistent identification is an important part of growing plants: without this, people who grow plants cannot communicate with people who sell plants; and people who grow plants (for pleasure or profit) cannot communicate or learn specific cultivation techniques, pests or diseases, propagation methods, or characteristics of their plants.
